## DISCLAIMER

The data and information in this report represents a fair and reasonable overview of the whole electricity supply industry. Every effort has been made to verify, validate and accurately represents the information in this report, based on the daily, monthly and yearly reports which were submitted by licensees pursuant to their license conditions. Where as, the information on the performance and statistics of utility in the state of Sarawak are submitted upon request by Sarawak Energy Berhad (SEB).

Energy Commission (EC) in good faith publishes this information for the consumption of the general public, in line with its function stipulated under the Act. ## INTRODUCTION

Electricity demand in Peninsular Malaysia increased by 7.8 percent from 94,748 GWh in 2009 to 102,139 GWh in 2010. Sales of electricity followed the same trend with a growth of 8.8 percent from 83,411 GWh in 2009 to settle at 90,770 GWh in 2010. The positive trend in electricity demand reflects the country's situation recovering from economic turmoil in 2009. Another factor which influenced the country's electricity demand was the climate change or the weather.

The highest maximum demand for the grid system in Peninsular Malaysia was recorded on 24th of May 2010. It showed about 5.8 percent growth from 14,245 MW in 2009 to 15,072 MW in 2010. The highest daily electricity demand was recorded on the 25th of May 2011 at 311.5 GWh, an increase of 7.4 percent compared to the previous year. In 2010, there was no additional installed generation capacity in Peninsular Malaysia. Therefore, the installed generation capacity remained at 21,817 MW as in the previous year. About 7,040 MW or 32.3 percent were generated by Tenaga Nasional Berhad (TNB) while the remaining were by the Independent Power Producers (IPPs). In 2010, the reserve margin for Peninsular Malaysia stood at 45 percent.

In Sabah, the highest daily electricity demand increased by 4.2 percent, from 14.2 GWh in 2009 to 14.8 GWh in 2010. The maximum demand was recorded at 779.7 MW from only 718.8 MW in 2009, indicating an increase of 8.5 percent. Growth in sales of electricity significantly increased by 8.1 percent from 3,818 GWh in 2009 to 4,127 GWh in 2010. The growth in sales was attributed to higher electricity demand from both commercial and domestic sectors. At present, Sabah is still facing supply insufficiency issue due to low availability and reliability of some power generators, especially diesel-based generators.

In order to meet the demand for electricity, initiatives to close the gap between supply and demand have been taken, such as by planting up new generation plants. In 2010, an additional 160.5 MW generation capacity was connected to the Sabah grid through the commissioning of Ranhill Powertron II (RPII) GT1 with a capacity of 65 MW on 6 March 2010. This was followed by GT2 with the same capacity on 10 July 2010. The remaining generation capacity came from mobile generators, POIC Lahad Datu (20 MW), Teck Guan Biomass Plant (6 MW) and Mini Hydro Station, Sungai Pangapuyan, Kota Marudu (4.5 MW). In 2010, the total installed generation capacity in Sabah was 1,216.4 MW, whilst dependable capacity was 1,111.1 MW. 375 MW or 33.8 percent was generated by SESB and the remaining by IPPs. Due to low availability and reliability of oil/diesel fired power generation plants, the reserve margin calculation for Sabah is not a good benchmark for reliability.

In terms of the reporting system, in its effort towards improving the performance of electricity supply in Peninsular Malaysia, TNB has upgraded their existing system that record System Average Interruption Duration Index (SAIDI). The development of the new system, known as Enhanced TOMS involves the integration of several softwares such as TOMS (TNB Outage Management System), eCIBS (Electronic Customer Information System) and ERMS (Enterprise Resource Management System) which will provide more detailed and accurate report on SAIDI. SAIDI for 2010 based on Enhanced TOMS recorded a higher reading of 96.3 minutes/consumer/year compared with SAIDI based on TOMS at 62.9 minutes/consumer/year, a difference of 33.4 minutes/consumer/year. The higher reading of SAIDI recorded by Enhanced TOMS is due to the ability of the new system to automatically record all interruptions, hence giving more accurate information on the performance of TNB supply system. However, based on TOMS, the overall performance of TNB distribution system in 2010 has shown an improvement, as SAIDI was at 4 percent lower compared to the previous year.

Meanwhile, SAIDI for Sabah has improved significantly with a reduction of 76 percent from 2,868 minutes/consumer/year in 2009 to 687 minutes/consumer/year in 2010. This significant reduction is a result of the commitment made by the government to achieve the target of 700 minutes/consumer/year of SAIDI in Sabah for 2010. To support this effort, the Federal Government allocated a total of RM419 for SESB to carry out fast-track SAIDI improvement projects.

In its efforts to ensure sufficient supply of electricity subsequent to the cancellation of submarine cable project from Bakun Hydro Electric in Sarawak to Peninsular Malaysia, the Government decided to plant-up new generation capacities of 2 x 1,000 MW in the window of 2015 and 2016. In line with the move towards market liberalisation, the Government has taken the initiative to implement a competitive bidding process in the development of the new power plants. Worldwide, this process has resulted in optimised plant up costs. The concession for the first 1,000 MW coal-fired power plant has been awarded to TNB Janamanjung Sdn. Bhd. It is expected to be commissioned by March 2015, the development of the second 1,000 MW unit is to be awarded via a restricted competitive bidding process and is scheduled to be in operation by March 2016. The Energy Commission (EC) has been mandated by the Government to implement the first competitive bidding process. Due to the urgency to meet the targeted commissioning date, the bidding process was restricted to owners of existing brownfield power plant sites, i.e. Tanjung Bin Power Sdn. Bhd. and Jimah Energy Ventures Sdn. Bhd.

In the year 2010, crude oil price increased more steadily in comparison to the previous year. Brent Spot Price of crude oil per barrel stood at between USD 75 to USD 85, compared to between USD 45 to USD 100 in 2009. The other fuels, such as natural gas, medium fuel oil (MFO) and coal followed a similar trend. Rising price of fuels has caused the Government to bear increased subsidies. To address this issue, the Government announced its plan to undertake tariff revision every 6 months based on the market price of crude oil. However, the plan was put on hold in 2010 and the average electricity tariff for Peninsular Malaysia remained at 31.31 sen/kWh.

In its efforts to ease the burden of low-income consumers, the Government gave assistance such as:

- i) Subsidies to domestic consumers whose electricity consumption cost do not exceed RM 20 per month; and
- ii) Lifeline tariff at 21.8 sen/ kWh for the first 200 units of electricity consumed.

The Energy Commission, with roles to protect consumers' interests and to ensure commercial viability of the utility industry, undertook a comprehensive assessment of the request for tariff revision by both TNB and SESB. One of the outcomes of the 5-month comprehensive review which ended in March 2010 was a recommended mechanism for a reasonable and fair tariff that benefits all parties. The study also reviewed the existing economic regulatory framework recommendations on mechanisms to enhance efficiency in the system.

As a result of the study, an Incentive-Based Regulatory (IBR) Framework was introduced. A set of eleven (11) Regulatory Implementation Guidelines was recommended each for the electricity and the piped gas supply industries. It is expected to change the way electricity tariff is set and revised in the future. Other initiatives include the separation of accounts for TNB activities according to divisions to enhance transparency and competitiveness of the electricity supply industry in Peninsular Malaysia.

## ELECTRICITY SUPPLY AND DEMAND

Chart 1 : Installed Capacity and Maximum Demand in Peninsular Malaysia from 2006 to 2010

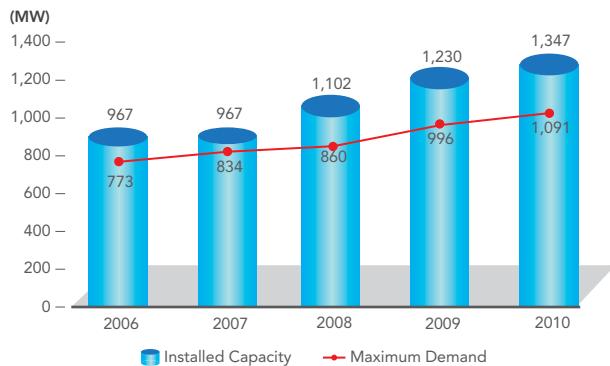

In 2010, the total installed capacity of TNB and IPP in Peninsular Malaysia remains at 7,040 MW and 14,777 MW respectively. However, the maximum demand of the grid system in Peninsular Malaysia has increased from 14,245 MW in 2009 to 15,072 MW, recorded on 24 May 2010. Due to increasing electricity demand, reserve margin has dropped from 53 percent in 2009 to 45 percent in 2010.

Chart 2 : Installed Capacity and Maximum Demand in Sabah from 2006 to 2010

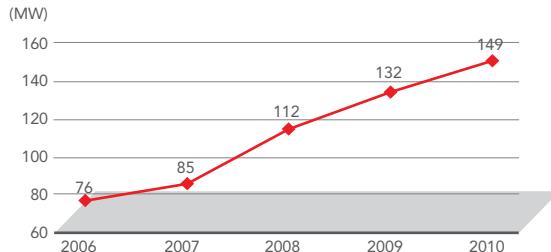

The maximum demand of the grid system in Sabah has increased by 8.5 percent from 718.8 MW in 2009 to 779.7 MW that was recorded on 23rd September 2010. The actual demand has exceeded the demand forecast in 2010 at 775 MW.

Chart 3 : Installed Capacity and Maximum Demand In Sarawak From 2006 To 2010

In Sarawak, the maximum demand of SESCO grid system has increased by 9.5 percent from 996 MW in 2009 to 1,091 MW, recorded in November 2010. Meanwhile, the total installed capacity has increased from 1,230 MW in 2009 to 1,347 MW in 2010. An additional capacity of 117 MW is due to the commissioning of new combined-cycle gas turbine in Sarawak Power Generation plant in April 2010.

Chart 4 : Maximum Demand in Kulim Hi-Tech Park (KHTP) reported by NUR Distribution Sdn. Bhd. from 2006 to 2010

Maximum demand in KHTP has increased from 76 MW in 2006 to 149 MW in 2010. The higher maximum demand in 2010 compared with the 2009 level was attributed by the entry of several large industrial users.

## 1.0 PERFORMANCE OF TNB & IPP GENERATION SYSTEM

Table 1 : Average Thermal Efficiency of TNB and IPP Generation Plant from 2006 to 2010

Year	2006		2007		2008		2009		2010	
	Type of Prime Mover	Average IPP	Average TNB	Average IPP						
Combined Cycle	46.3	41.3	45.2	41.5	44.8	41.2	44.3	41.0	41.9	41.2
Open Cycle	26.6	26.0	27.6	25.9	26.1	25.6	27.4	17.4	27.3	22.6
Conventional (Oil/Gas)	32.5	29.4	32.4	27.8	32.2	18.3	31.9	0.0	32.3	25.6
Conventional (Coal)	33.9	-	33.9	-	33.8	-	34.7	-	33.1	-

Chart 5 : Average Thermal Efficiency of TNB and IPP Generation Plant from 2009 to 2010

In 2010, the yearly average thermal efficiency for TNB's combined cycle plants and open cycle plants recorded an increase of 0.2 percent and 5.2 percent respectively. The increase of average thermal efficiency was resulted from more holistic thermal measurements in 2010. Meanwhile, the average thermal efficiency of IPP's combined cycle plants dropped from 44.3 percent in 2009 to 41.9 percent in 2010. However, the efficiency of IPP's open cycle plants remain almost the same as in 2009.

For TNB's conventional thermal power plants using oil/gas, the yearly average thermal efficiency in 2010 was at 25.6 percent. Starting from 2005, all conventional generation plants using coal in the country were operated by IPPs. The average thermal efficiency for IPP's thermal power plants using coal has decreased from 34.7 percent in 2009 to 33.1 percent in 2010.

Table 2 : Average Equivalent Availability Factor (EAF) of TNB and IPP Generation Plants from 2006 to 2010

Year	2006		2007		2008		2009		2010	
	Type of Prime Mover	Average IPP	Average TNB	Average IPP						
Combined Cycle	93.1	87.1	87.0	89.4	90.7	90.7	91.2	93.2	90.6	90.5
Open Cycle	97.0	95.0	99.2	95.9	98.1	97.0	98.4	97.3	97.9	92.6
Conventional (Coal)	92.1	-	88.8	-	78.5	-	78.0	-	84.3	-
Conventional (Oil/Gas)	-	86.5	-	99.2	78.1	99.9	83.2	99.3	88.2	98.1
Hydro	-	93.3	-	82.2	-	91.3	-	95.3	-	86.0

In 2010, the average equivalent availability factor (EAF) for thermal power plants based on coal for IPP has showed an improvement when compared to the EAF in the previous year. The overall performance of both combined-cycle and open-cycle gas turbine were at the satisfactory level with the achievement of more than 90 percent EAF for IPP and TNB.

Table 3 : Average Equivalent Unplanned Outage Factor (EUOF) of TNB and IPP Generation Plant from 2006 to 2010

Year	2006		2007		2008		2009		2010	
	Type of Prime Mover	Average IPP	Average TNB	Average IPP						
Combined Cycle	N/A	3.3	N/A	2.7	1.07	2.11	3.31	1.61	2.97	2.29
Open Cycle	N/A	2.4	N/A	1.0	0.71	1.73	0.61	0.93	0.89	3.99
Conventional (Coal)	5.2	-	3.1	-	11.17	-	12.40	-	7.77	-
Conventional (Oil/Gas)	-	4.5	-	0.2	5.12	-	11.85	-	4.38	0.33
Hydro	-	N/A	-	N/A	-	N/A	-	1.35	-	0.37

In general, the target of EUOF for both combined-cycle and open-cycle power generating plants are at 4 percent while the target of for oil/gas power generating plant is at 6 percent. It reflects the better performance of open-cycle and combined-cycle power plants compared to the conventional power plants based on oil/gas and coal.

## 2.0 PERFORMANCE OF TNB TRANSMISSION SYSTEM

Note :

\* Including Tripping Incident in Pulau Pinang on 20 November 2007

In 2010, TNB's transmission system has lower performance compared to the previous year. This is due to the increment in the number of tripping to 4 in 2010 compared to only 2 in 2009. Meanwhile, the amount of unsupplied energy has also increased to 310 MWh, an increase of 96.2 percent from the previous year.

Chart 7 : Delivery Point Unreliability Index (DePUI) - System Minutes TNB from 2006 to 2010

System minutes can be one of the indicators used to measure the performance of TNB transmission system with low system minutes indicating a better performance of TNB transmission system. The chart above showed that starting from 2007, TNB transmission system had been improving with lower system minutes being reported each year. In 2010, system minutes was reported at only 0.85 compared to 1.02 in the previous year.

### 3.0 PERFORMANCE OF TNB DISTRIBUTION SYSTEM

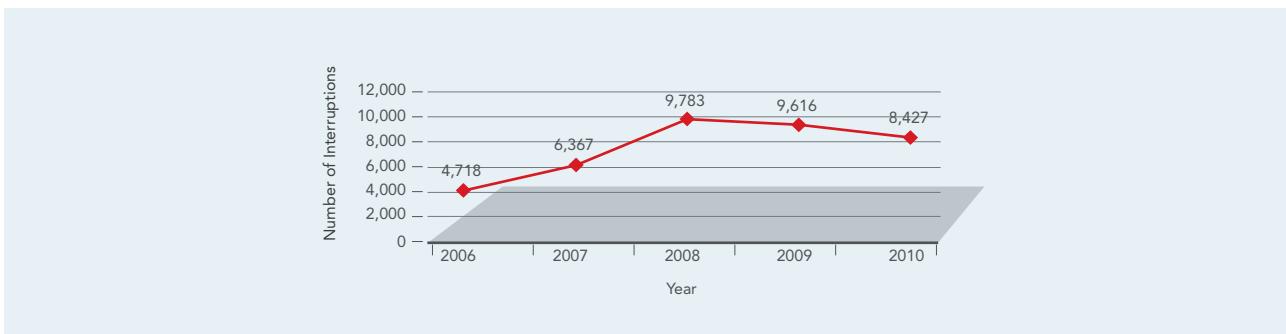

#### TNB ELECTRICITY SUPPLY INTERRUPTIONS

Chart 8 : Number of Electricity Supply Interruptions per 1,000 Consumers from 2006 to 2010

In September 2007, TNB has started using new software namely Total Outage Management System (TOMS) to monitor and report the performance of electricity supply system. Based on the report obtained, the number of electricity supply interruptions per 1,000 consumers in 2010 has reduced by 15.7 percent compared to 2009. Out of the total, the number of unscheduled interruptions remains dominating the total number of interruptions. In general, reduction in the number of interruptions per 1,000 consumers indicates a better performance of TNB distribution system.

Chart 9 : Monthly Average Electricity Supply Interruptions from 2006 to 2010

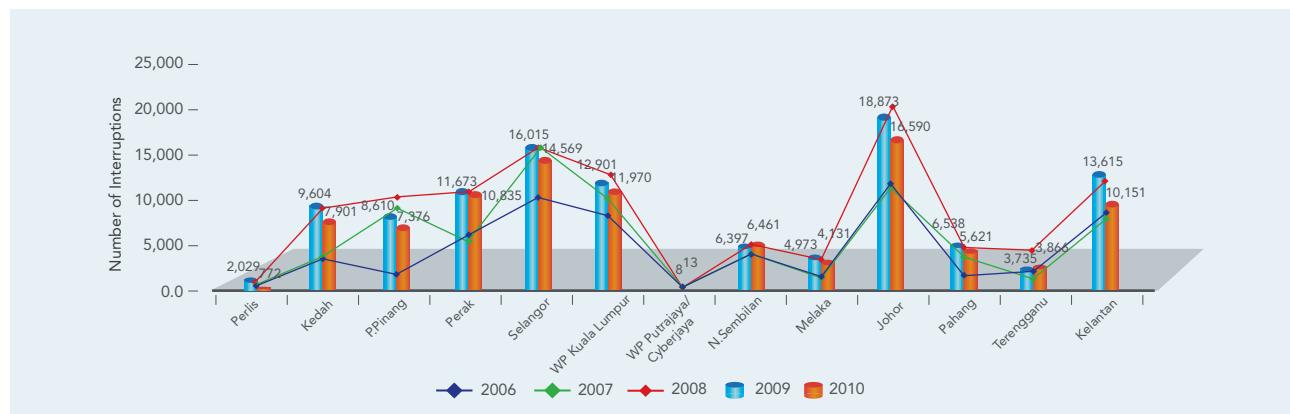

Note :

Chart 9 contains an updated 2009 figure

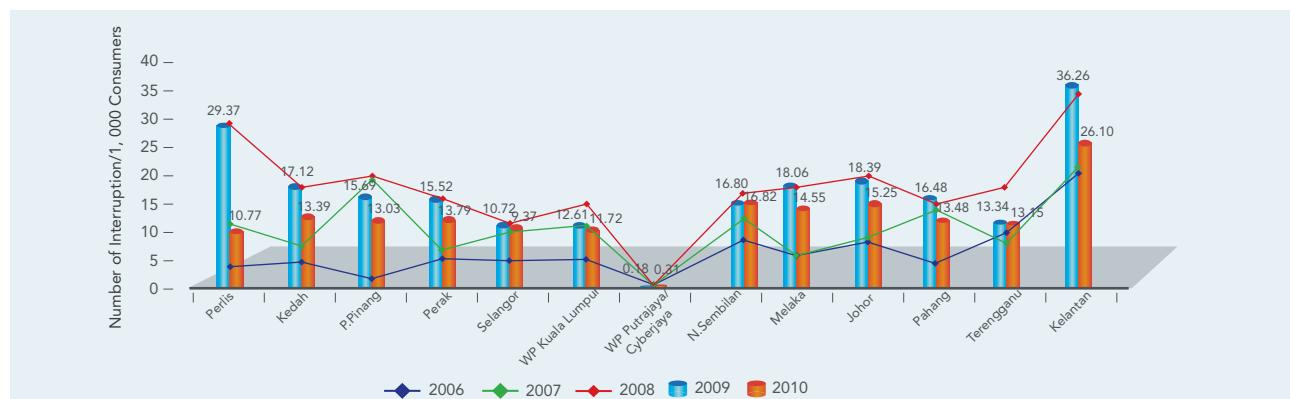

Monthly average is taken from the total number of interruption of a year divided by 12 months. From the chart, the average number of the interruptions has decreased by 12.4 percent from 9,616 number of average interruptions in 2009 to settle at 8,427 number of average interruptions in 2010.

Chart 10 : Number of Electricity Supply Interruptions by State from 2006 to 2010

In total, the overall electricity supply interruption in Peninsular Malaysia in 2010 has decreased about 12 percent from the previous year. State of Johor recorded the highest number of electricity supply interruptions while WP Putrajaya/Cyberjaya recorded otherwise for both year 2009 and 2010.

Chart 11 : Number of Electricity Supply Interruptions per 1,000 Consumers by State from 2006 to 2010

In 2010, the state of Kelantan has recorded the highest number of electricity supply interruptions per 1,000 consumers with electricity supply interruptions of 26.10 per 1000 consumers compared to other states in Peninsular Malaysia. However, this figure was lower compared to the previous year with the electricity supply interruptions of 36.26 per 1,000 consumers.

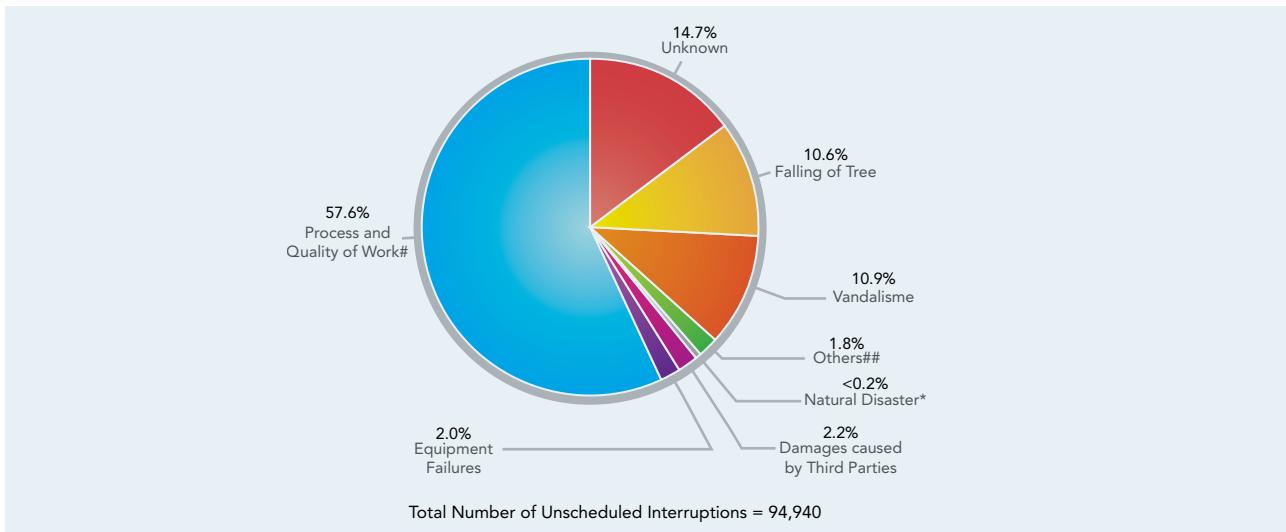

Table 8 : Percentage of Supply Interruptions by Voltage Level in 2010

Voltage level	Number of Interruptions	Percentage Share
High Voltage – HV (66 kV and above)	24	0.02
Medium Voltage – MV (6.6 kV to 33 kV)	12,170	12.03
Low Voltage – LV (1 kV and below)	88,932	87.95
<b>Total</b>	<b>101,126</b>	<b>100.00</b>

Low voltage interruptions have dominated the total of supply interruptions by 87.95 percent. However, in the case of the low voltage interruptions, it only involves a small number of consumers.

## CAUSES OF TNB ELECTRICITY SUPPLY INTERRUPTIONS

Chart 12 : Causes of Unscheduled Electricity Supply Interruptions in 2010

Nota :

\* Natural disaster caused by wind, storm, flood, landslide and others.

# Loose contact, poor quality of work, overloading and improper maintenance.

## Other causes such as damaged installation, ageing of insulation, design defects, relay malfunction, transient overload, short circuit, encroachment/vandalism and maloperation of protection system.

Table 10 : SAIDI, SAIFI, CAIDI in Peninsular Malaysia by Voltage Level in 2010

Voltage Level	SAIDI	SAIFI	CAIDI
Low Voltage ( 1 kV and below)	6.98	0.05	136.9
Medium Voltage (6.6 kV - 33 kV)	88.10	1.17	75.5
High Voltage (66 kV and above)	1.17	0.01	114.6
<b>Total</b>	<b>96.25</b>	<b>1.23</b>	<b>78.3</b>

By using Enhanced TOMS, SAIDI recorded in 2010 was at 96.25 minutes/consumer/year. However, by using TOMS, SAIDI recorded was at 62.88 minutes/consumer/year.

SAIDI and SAIFI were contributed mainly by the medium voltage interruptions with 88.10 minutes/ consumer/ year and 1.17 interruptions/ consumer/ year respectively. On the other hand, CAIDI was contributed mainly by the low voltage interruptions with 136.9 minutes/ interrupted consumer/year.

## 4.0 POWER QUALITY

### OVERVOLTAGE INCIDENTS

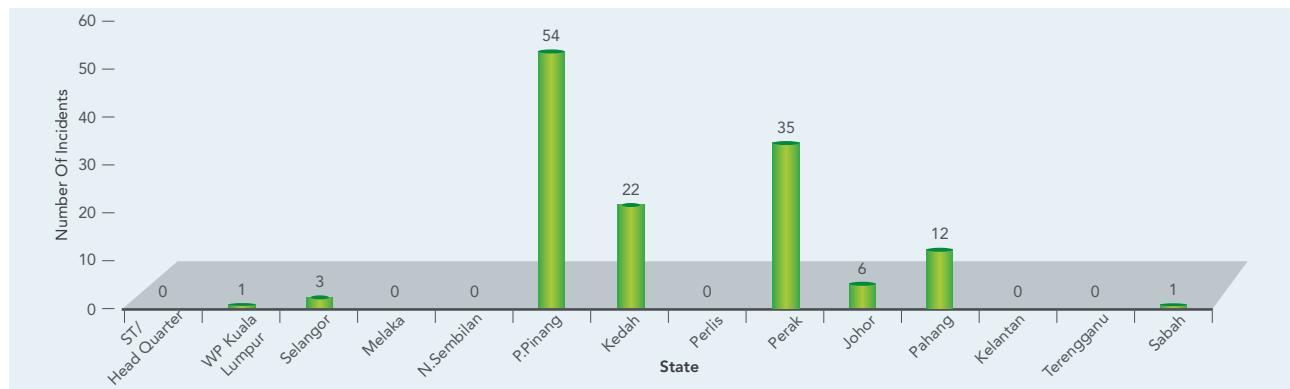

Chart 19 : Number of Overvoltage Incidents from 2006 to 2010

Including the number of overvoltage incidents in Peninsular Malaysia and Sabah

Power quality has showed an improvement since 2007 with lower number of reported overvoltage incidents each year. In 2010, the number of overvoltage incidents has decreased by 27.7 percent from 183 incidents in 2009 to settle at 134 incidents in 2010. Most of overvoltage incidents occurred due to poor connection of neutral conductor because of loose IPC, missing of neutral busbar at substation due to theft or vandalism and neutral conductor snapped or dislodged due to tree falling on cable line.

## 6.0 PERFORMANCE OF NUR DISTRIBUTION SDN. BHD. IN KULIM HI-TECH PARK (KHTP)

### ELECTRICITY SUPPLY INTERRUPTIONS

Chart 23 : Number of Electricity Supply Interruptions in KHTP by NUR Distribution Sdn. Bhd. per 1,000 Consumers from 2006 to 2010

In total, the number of interruptions per 1,000 consumers in 2010 has increased slightly when compared to the previous year. This is contributed mainly by the increase in number of unscheduled interruptions per 1,000 consumers in KHTP from 13 interruptions per 1,000 consumers in 2009 to 18 interruptions per 1,000 consumers in 2010.

Chart 24 : Number of Scheduled Electricity Supply Interruptions in KHTP by NUR Distribution Sdn. Bhd. from 2006 to 2010

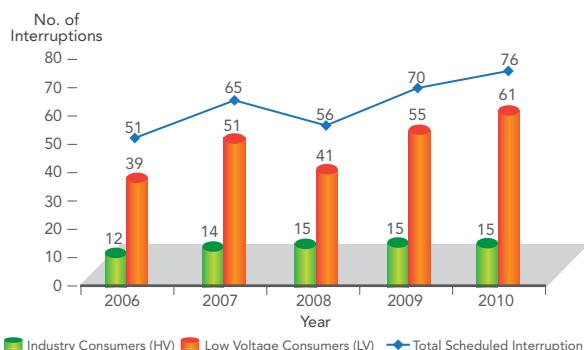

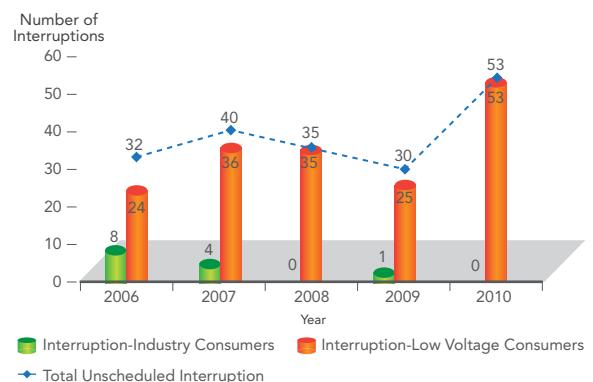

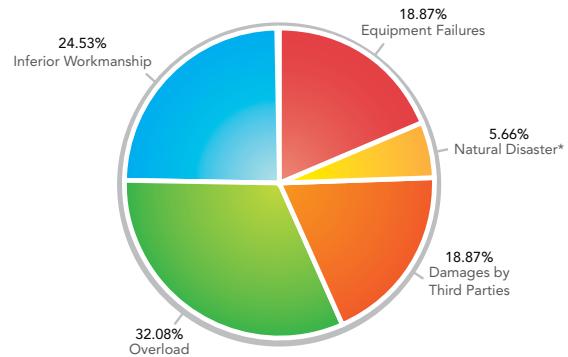

Chart 25 : Number of Unscheduled Electricity Supply Interruptions in KHTP by NUR Distribution Sdn. Bhd. from 2006 to 2010

### CAUSES OF NUR ELECTRICITY SUPPLY INTERRUPTIONS

Chart 26 : Causes of Unscheduled Supply Interruptions in KHTP by NUR Distribution in 2010

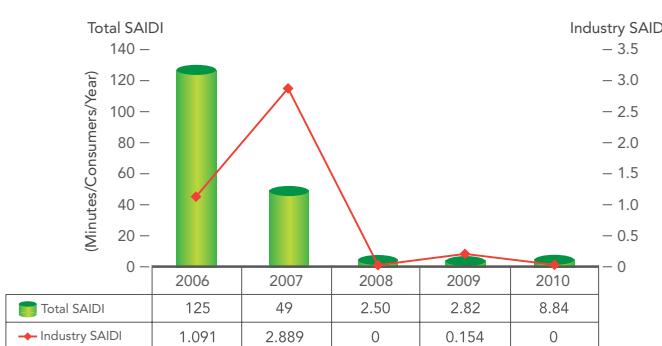

Number of Unscheduled Interruptions = 53

Note :

\* Natural disaster caused by wind, storm, flood, landslides, etc

## SYSTEM AVERAGE INTERRUPTION DURATION INDEX (SAIDI)

Chart 27 : SAIDI (Minutes/Consumer/Year) NUR Distribution Sdn. Bhd. from 2006 to 2010

In 2010, the overall SAIDI indicator reported a decline in the performance of electricity supply in KHTP compared to the previous year. SAIDI was recorded at 8.84 minutes/consumer/year, an increase of 213% from the previous year in 2009. However, the industrial SAIDI for 2010 showed a tremendous performance with zero incidents.

## 7.0 ELECTRICITY SUPPLY QUALITY OF NUR DISTRIBUTION SDN. BHD.

Chart 28 : Number of Voltage Dips Incidents Reported In KHTP from 2006 to 2010

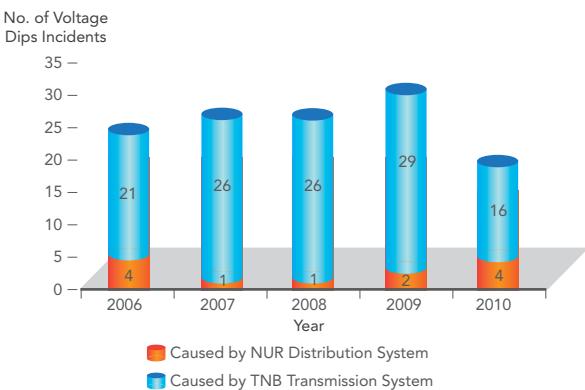

Chart 29 : Number of Consumers Involved In Voltage Dips Incidents In KHTP from 2006 to 2010

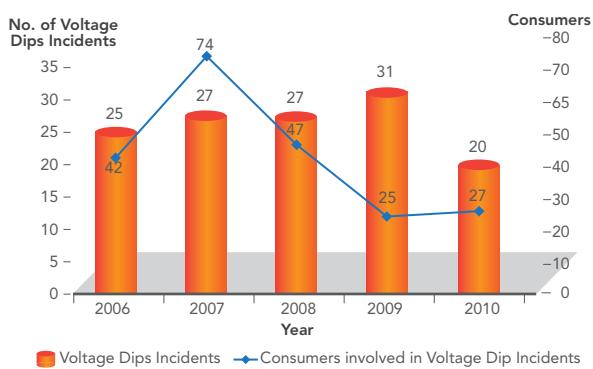

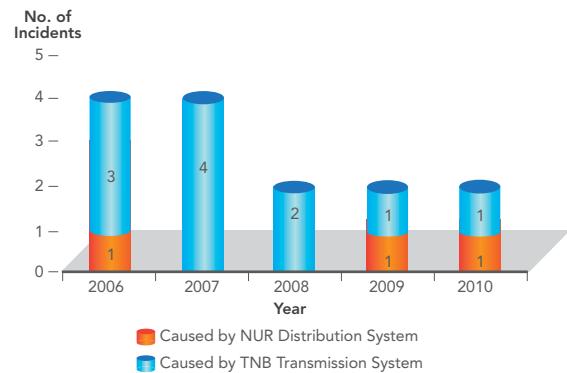

Chart 30 : SARFI<sub>70</sub> for NUR Distribution Sdn. Bhd. from 2006 to 2010

In 2010, the number of voltage dips incidents with magnitude below 70% caused by 70% of nominal voltage (SARFI<sub>70</sub>) remain unchanged as in 2009 with only 2 incidents.

# PERFORMANCE OF ELECTRICITY SUPPLY AND SERVICES IN SABAH

## 1.0 PERFORMANCE OF SESB GENERATION SYSTEM

Chart 31 : Unplanned Outage Rate (UOR) in Sabah in 2010

In 2010, most of the diesel generating power plants operated by IPPs and SESB recorded a high rate of forced outage. This situation was attributed by the unwarranted breakdowns caused by several factors such as aging installations, limited window for maintenance, "overworked" power plants, low quality of fuel, etc. Despite the poor performance of the diesel generating power plants, the new gas power plants showed a better performance with a lower unscheduled forced outage rate.

## 2.0 PERFORMANCE OF SESB TRANSMISSION SYSTEM

Table 14 : Transmission System Tripping with Load Loss above 50 MW in Financial Year 2009/2010

In 2010, the number of tripping without load shedding for SESB transmission system has decreased by 7 from 8 in 2009. Meanwhile, the number of tripping with load shedding incidents showed otherwise with 75 incidents in 2010 compared to only 55 incidents in 2009.

• Tripping incident of both 275 kV Kolopis-Segaliud lines, in the East Coast Sabah with 124 MW of load loss on 30 September 2007;

• HV fault at Karamunting Sub-station with 308 MW of load loss on 6 November 2011; and

• Collapsed of 132 kV transmission tower of Kayu Madang lines inside the area of Universiti Malaysia Sabah (UMS) due to theft of metal part of the tower, causing a 459.3 MW of load loss on 21 April 2008.

Financial Year 2009/10

In 2010, total number of tripping incidents for both cables and lines per 100 cct-km has increased significantly by 276 percent when compared to its 2009 level. Among all, the cables and lines of 66 kV contributed the highest number of tripping incidents.

### 3.0 PERFORMANCE OF SESB DISTRIBUTION SYSTEM

#### SESB ELECTRICITY SUPPLY INTERRUPTIONS

Chart 32: Number of Electricity Supply Interruptions per 1,000 Consumers from 2006 to 2010

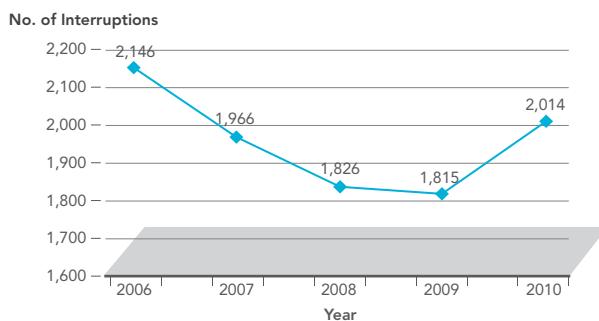

Note:

Number of Electricity Supply Interruptions per 1,000 Consumers exclude the number of interruptions in SESB transmission and generation system

In 2010, the average interruptions for every 1,000 consumers increased by 5.9 percent compared to its 2009 level.

Unscheduled interruptions contributes about 88 percent out of the total average interruptions.

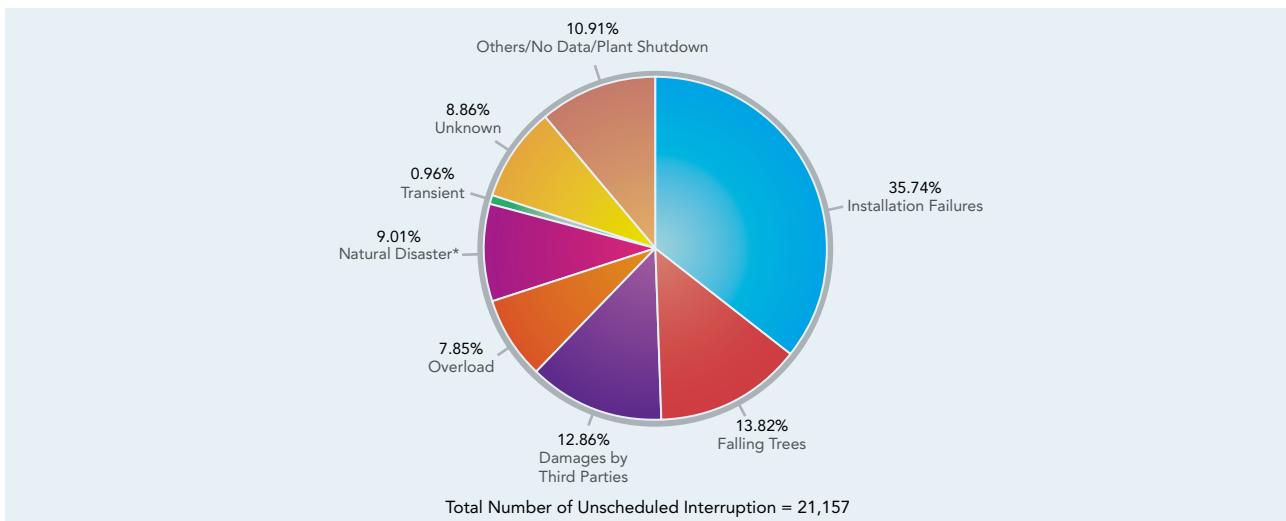

Chart 33: Monthly Average Electricity Supply Interruptions from 2006 to 2010

The monthly average of electricity supply interruptions has increased by 11 percent from 1,815 interruptions in 2009 to 2,014 interruptions in 2010.

## CAUSES OF SESB ELECTRICITY SUPPLY INTERRUPTIONS

## SYSTEM AVERAGE INTERRUPTION DURATION INDEX (SAIDI), SYSTEM AVERAGE INTERRUPTION DURATION INDEX (SAIFI) AND CUSTOMER AVERAGE INTERRUPTION INDEX (CAIDI)

Chart 35 : SAIDI (Minutes/Consumer/Year) in Sabah from 2006 to 2010

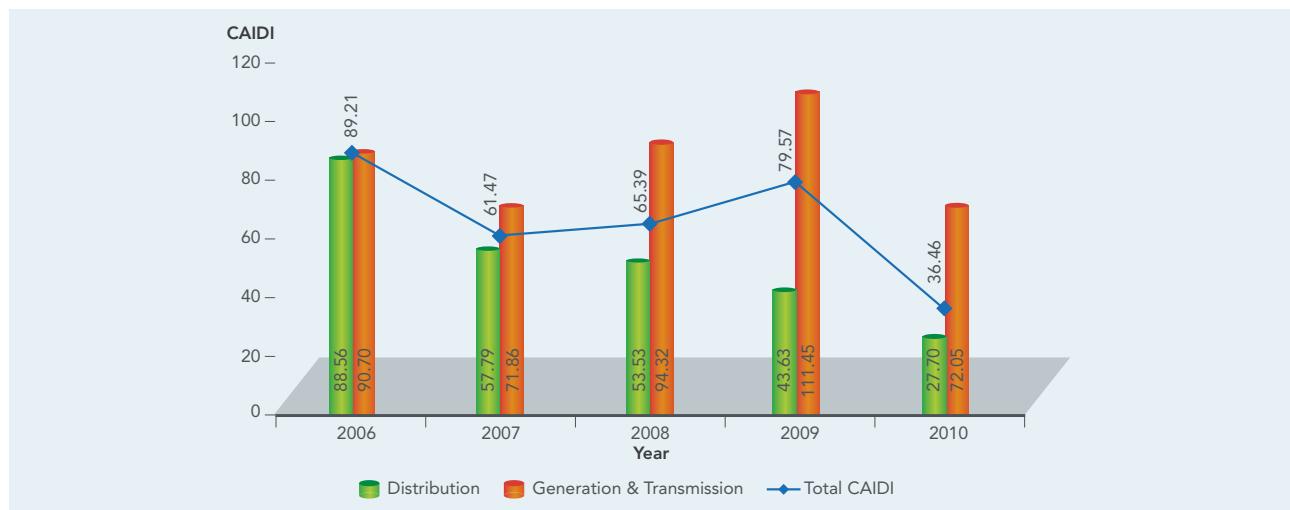

In 2010, SESB supply system showed a better performance compared to the previous year. SAIDI for distribution system has dropped by 41 percent from 739 minutes in 2009 to 434 minutes in 2010. SAIDI for generation and transmission system also showed a significant reduction about 88 percent from 2,129 minutes in 2009 to 254 minutes in 2010.

Chart 36 : SAIFI (Number of Interruptions/Consumer/Year) in Sabah from 2006 to 2010

SAIFI for distribution system in Sabah has reduced by 4.78 percent from 16.94 number of interruptions/consumer/ year in 2009 to 16.13 in 2010 while SAIFI for generation and transmission system has reduced by 79.21 percent from 19.10 number of interruptions/consumer/year in 2009 to 3.97 in 2010.

Chart 37 : CAIDI (Minutes/Interrupted Consumer/Year) in Sabah from 2006 to 2010

In 2010, the overall CAIDI for SESB has reduced by 54.18 percent. This is mainly attributed by a reduction in CAIDI for distribution system by 36.52 percent and a reduction in CAIDI for generation system by 35.35 percent.

# PERFORMANCE OF ELECTRICITY SUPPLY AND SERVICES IN SARAWAK

## 1.0 PERFORMANCE OF SESCO TRANSMISSION SYSTEM

Table 18 : Number of Monthly Tripping for SESCO Transmission System with Load Loss above 50 MW in 2010

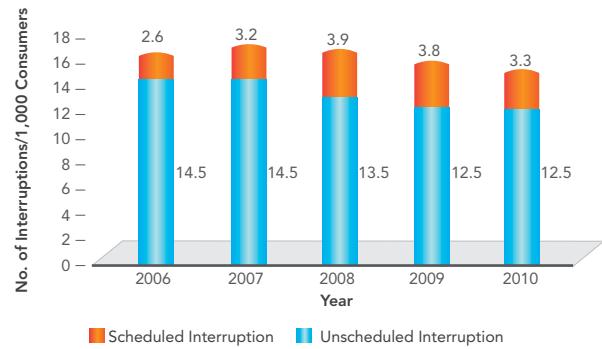

Indicators	Jan	Feb	March	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Number of tripping without load shedding	0	0	0	1	0	2	1	2	0	0	1	0
Number of tripping with load shedding	1	5	2	5	7	2	1	3	2	0	0	1

Unsupplied energy during load shedding (MWh)	62	258	98	98	335	156	8	75	83	0	0	34

In 2010, the number of tripping without load shedding in SESCO transmission system has increased with 3 more incidents. Similarly with the number of tripping with load shedding in SESCO transmission system, it has increased from only 13 incidents reported in 2009 to 29 incidents being reported in 2010.

## 2.0 PERFORMANCE OF SESCO DISTRIBUTION SYSTEM

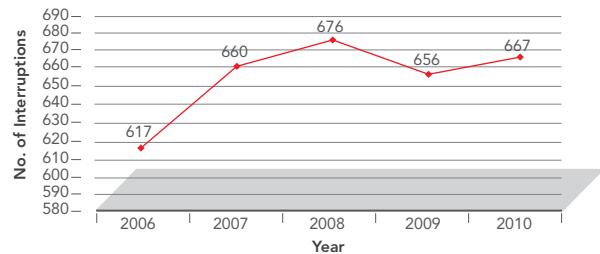

### SESCO ELECTRICITY SUPPLY INTERRUPTIONS

Chart 38 : Number of Electricity Supply Interruptions per 1,000 Consumers from 2006 to 2010

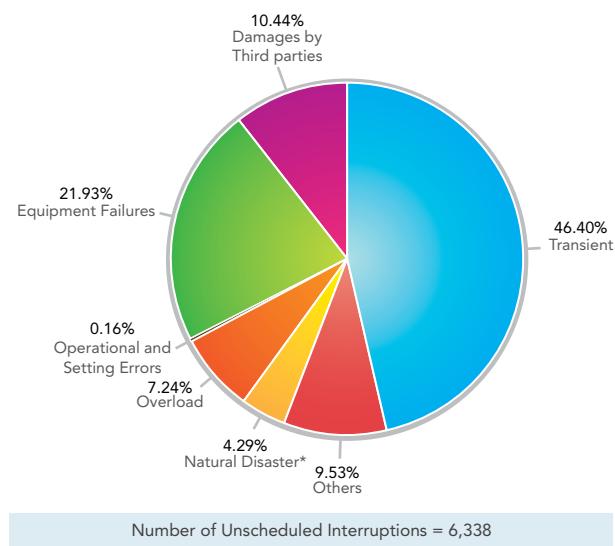

The number of electricity supply interruptions per 1,000 consumers has slightly decreased by 3.1 percent in 2010 when compared to 2009 level. The number of unscheduled interruptions dominates by 77 percent out of the total number of electricity supply interruptions.

Chart 39 : Monthly Average Electricity Supply Interruptions from 2006 to 2010

Average monthly interruptions is measured by total number of electricity supply interruptions devided by 12 months in a year. In 2010, the monthly average of interruptions has increased by 1.72 percent from 656 number of interruption in 2009.

<sup>3</sup> Free units are government initiative targeting the low income group from residential/domestic sector where exemptions are given for consumers with monthly electricity consumption of not more than RM20

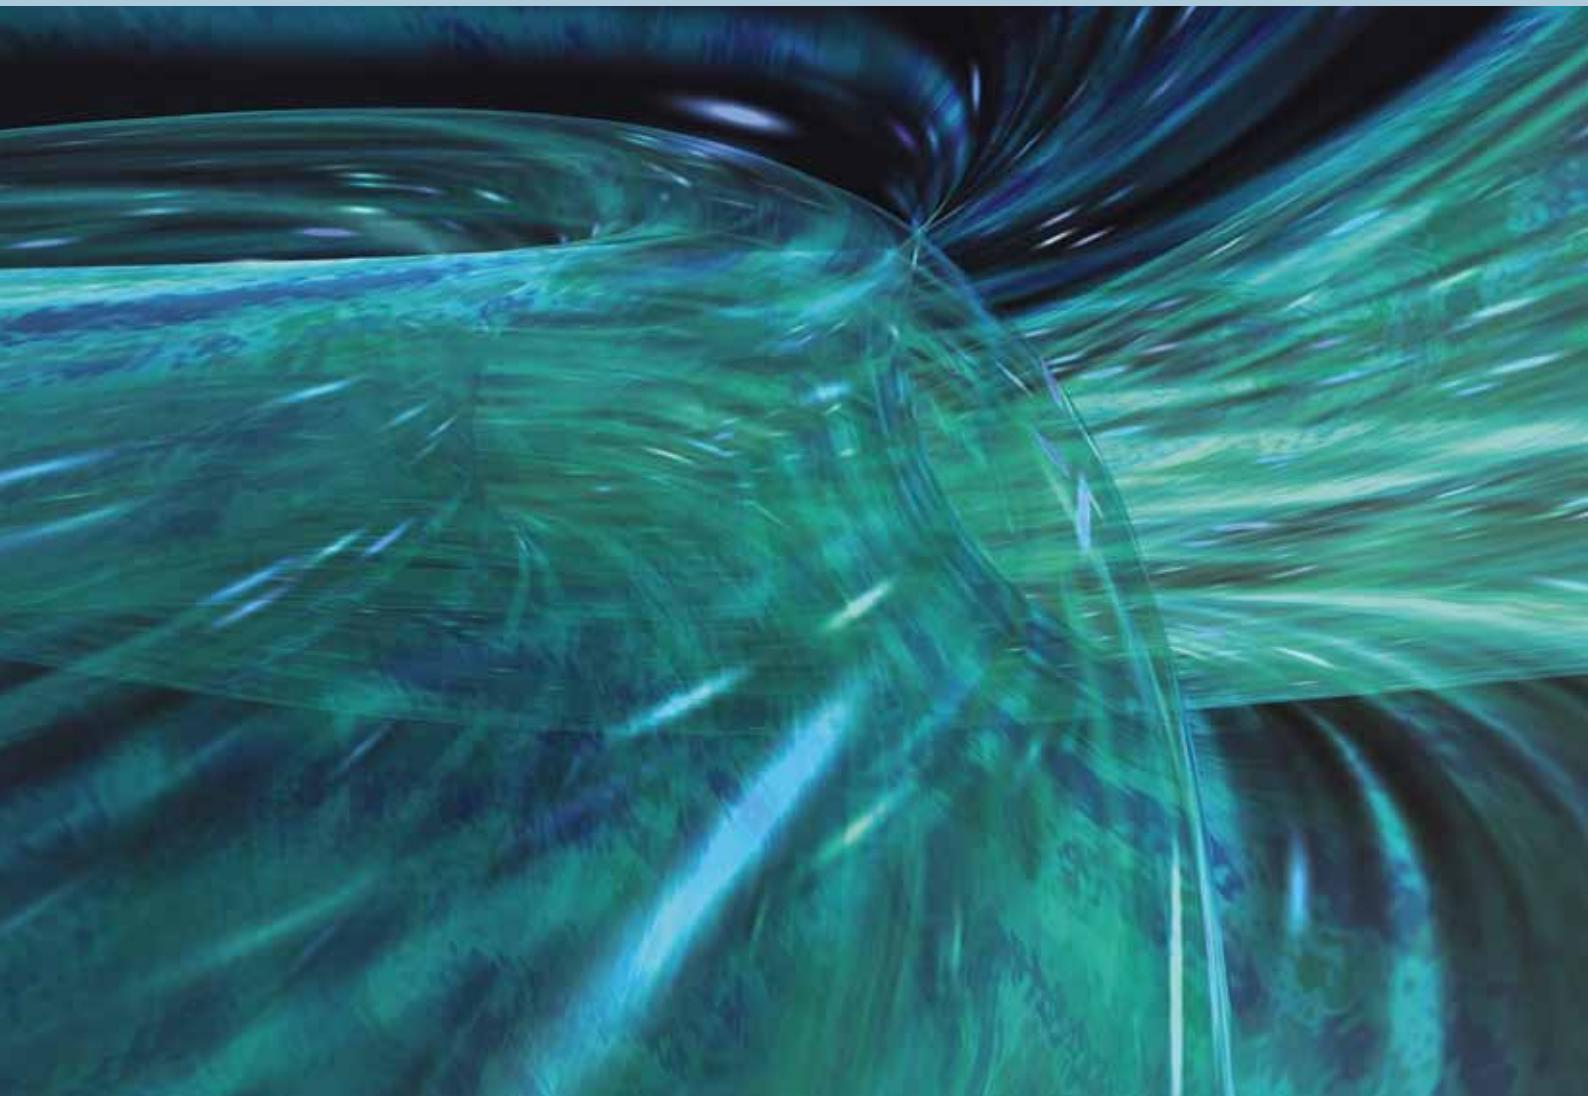

<sup>4</sup> From 2006 to 2008, 440km transmission lines at 500 kV were operated at 275 kV.

<sup>5</sup> In 2009, 541km transmission line at 500 kV were operated at 275kV

<sup>6</sup> In 2010, 426km transmission line at 500 kV were operated at 275kV

<sup>7</sup> Including 48 large power consumer substations

<sup>8</sup> This figure includes consumers with duration of interruptions of more than 1 minute
